

**WHAT IS CLAIMED IS:**

1.A packaging body for heating processing, in which identical surface sides of plastic film are contacted with each other and is fabricated into a bag in a rectangular shape by heat seal and, a vapor communication joining section in a rafter roof shape is provided at one location of said heat seals, whereby the contents for heating processing is made tightly sealed and packaged within fabricated bag thereof, wherein

said plastic film is a film whose entire joining surface is highly dependent on temperature,

said vapor communication joining section is formed so as to be parallel to the longitudinal direction of said rectangularly shaped packaging body, and

the relevant vapor communication joining section is a seal having an easily opening seal property located on the upper surface side of said packaging body when the contents is heating-processed and making pressure thereof escape when an internal pressure of said packaging body rise due to heating.

2. A packaging body for heating processing, in which identical surface sides of plastic film are contacted with each other and is fabricated into a bag by heat seals and, a vapor communication joining section in a rafter roof shape is provided at one location of said heat seals, whereby the contents for heating processing is made tightly sealed and packaged within fabricated bag thereof, wherein

a film having a high dependency on temperature is intervened between said plastic films at said vapor

communication joining section,

the relevant vapor communication joining section is a seal having an easily opening seal property located on the upper surface side of said packaging body when the contents is heating-processed and making pressure thereof escape when an internal pressure of said packaging body rise due to heating.

3. The packaging body for heating processing according to claim 1 or 2, wherein a force of peeling off of a seal having an easily opening seal property is equal to or more than 3 kg f / 15 mm during the usual condition, and a force of peeling off of said seal having an easily opening seal property ranges from 0 to 1,200 g f / 15 mm at 90°C.

4. The packaging body for heating processing according to claim 2, wherein a film highly dependent on temperature in said vapor communication joining section is a tape inserted between said plastic films.
